

# OSGi enRoute

An Development Chain for OSGi

**αβ**

The existential  
question

Why OSGi?

“Hello World”

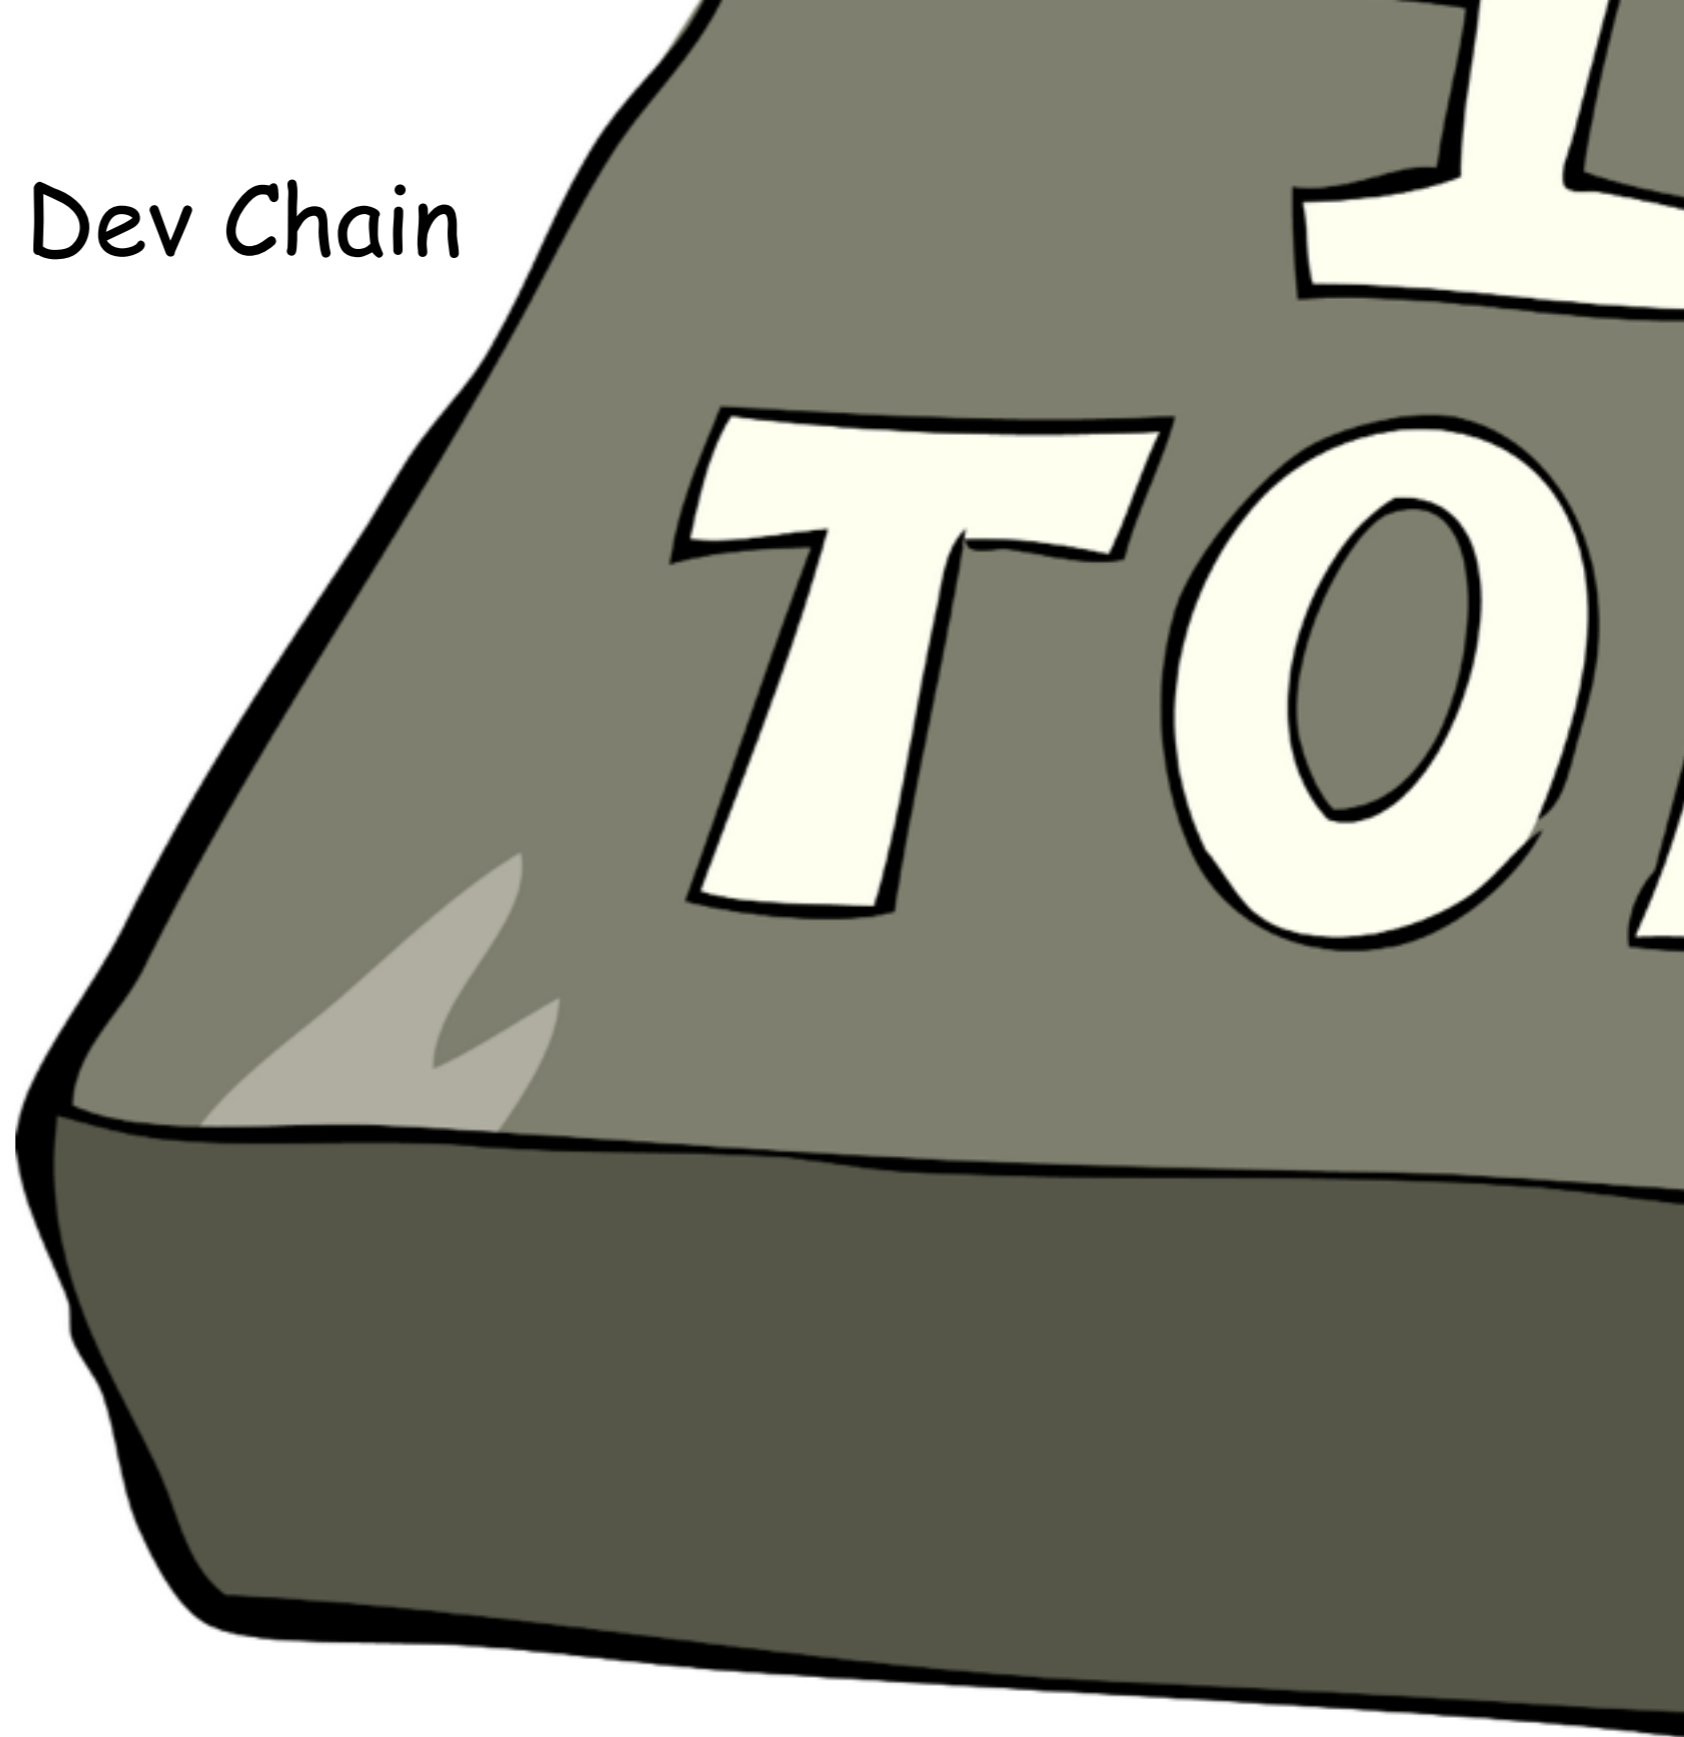

... is not a benchmark

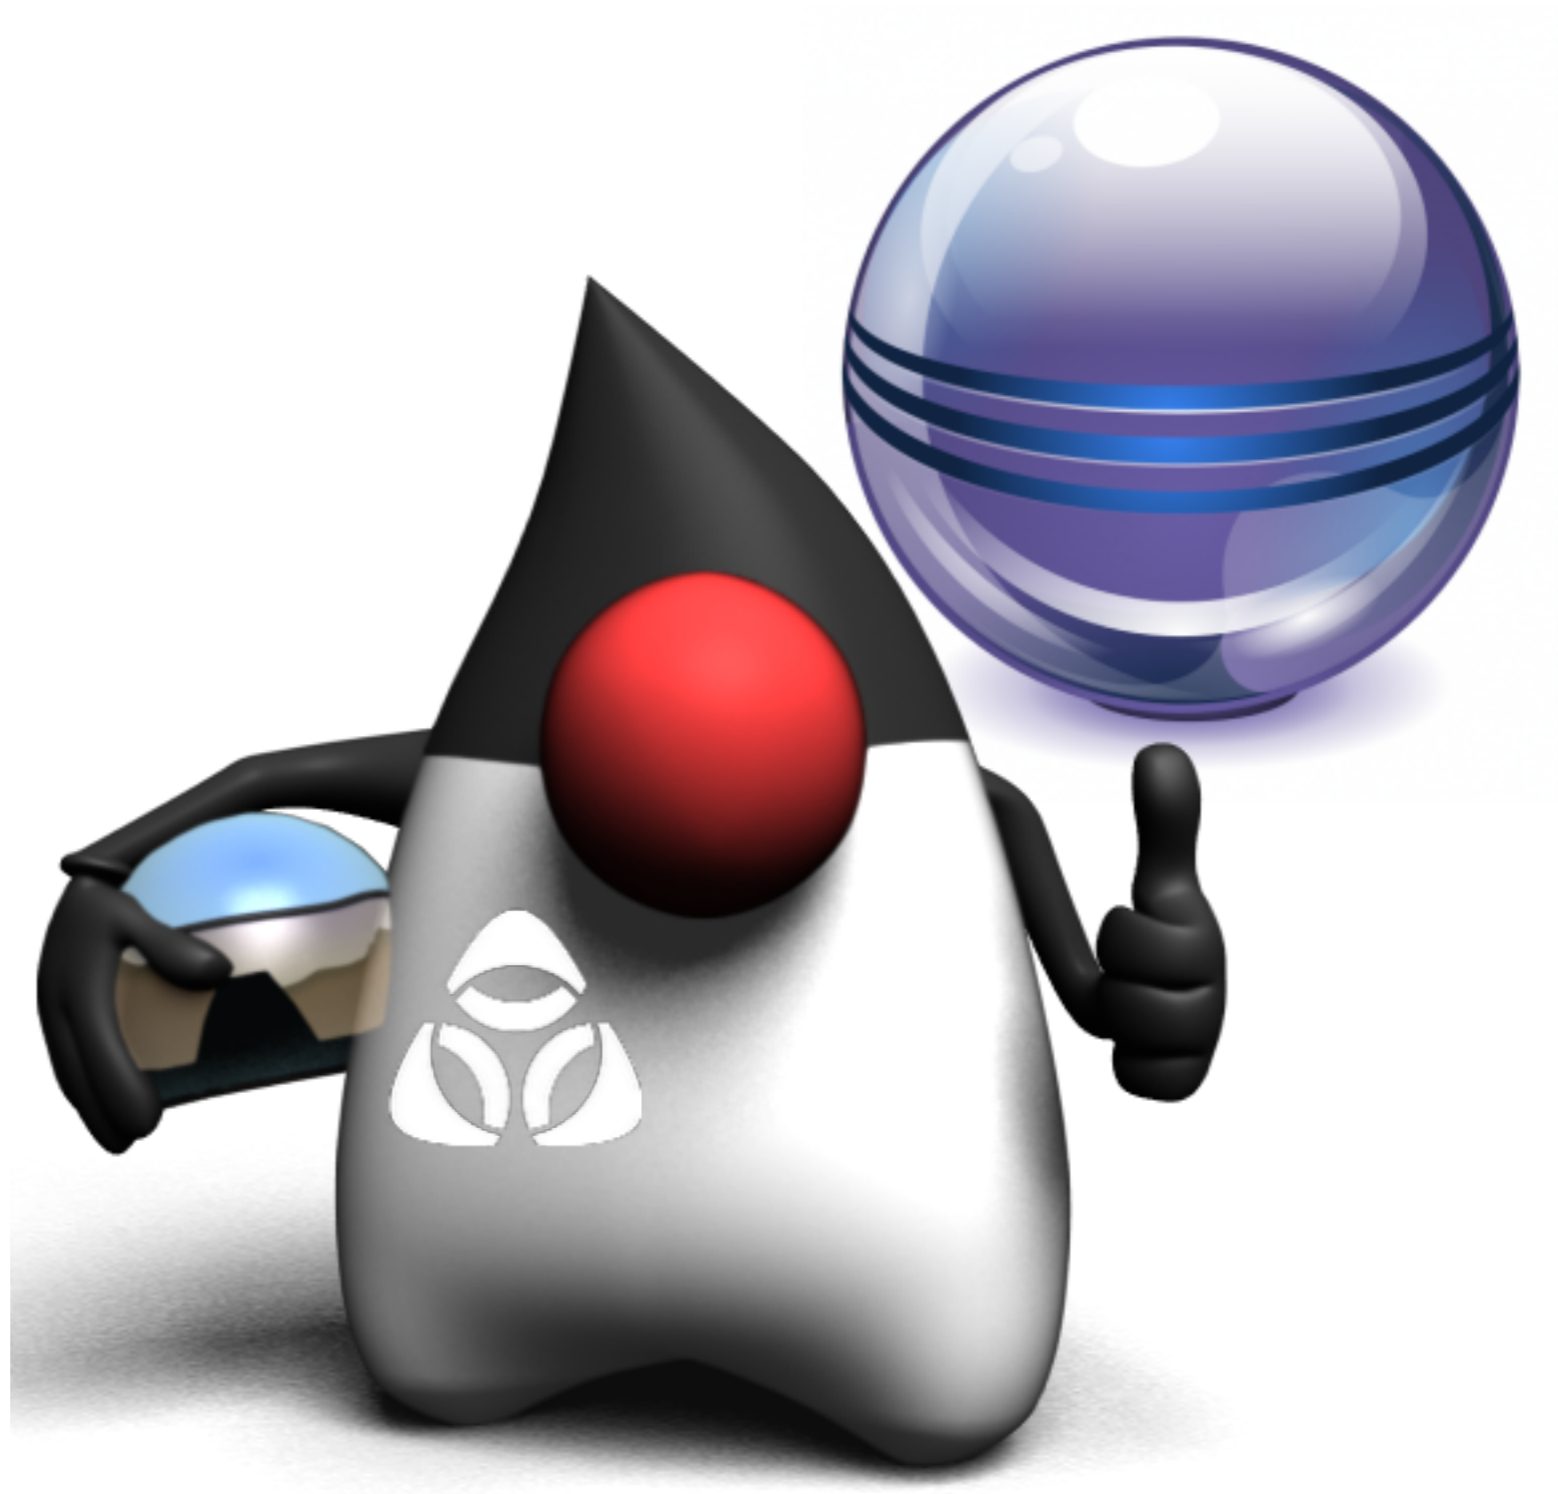

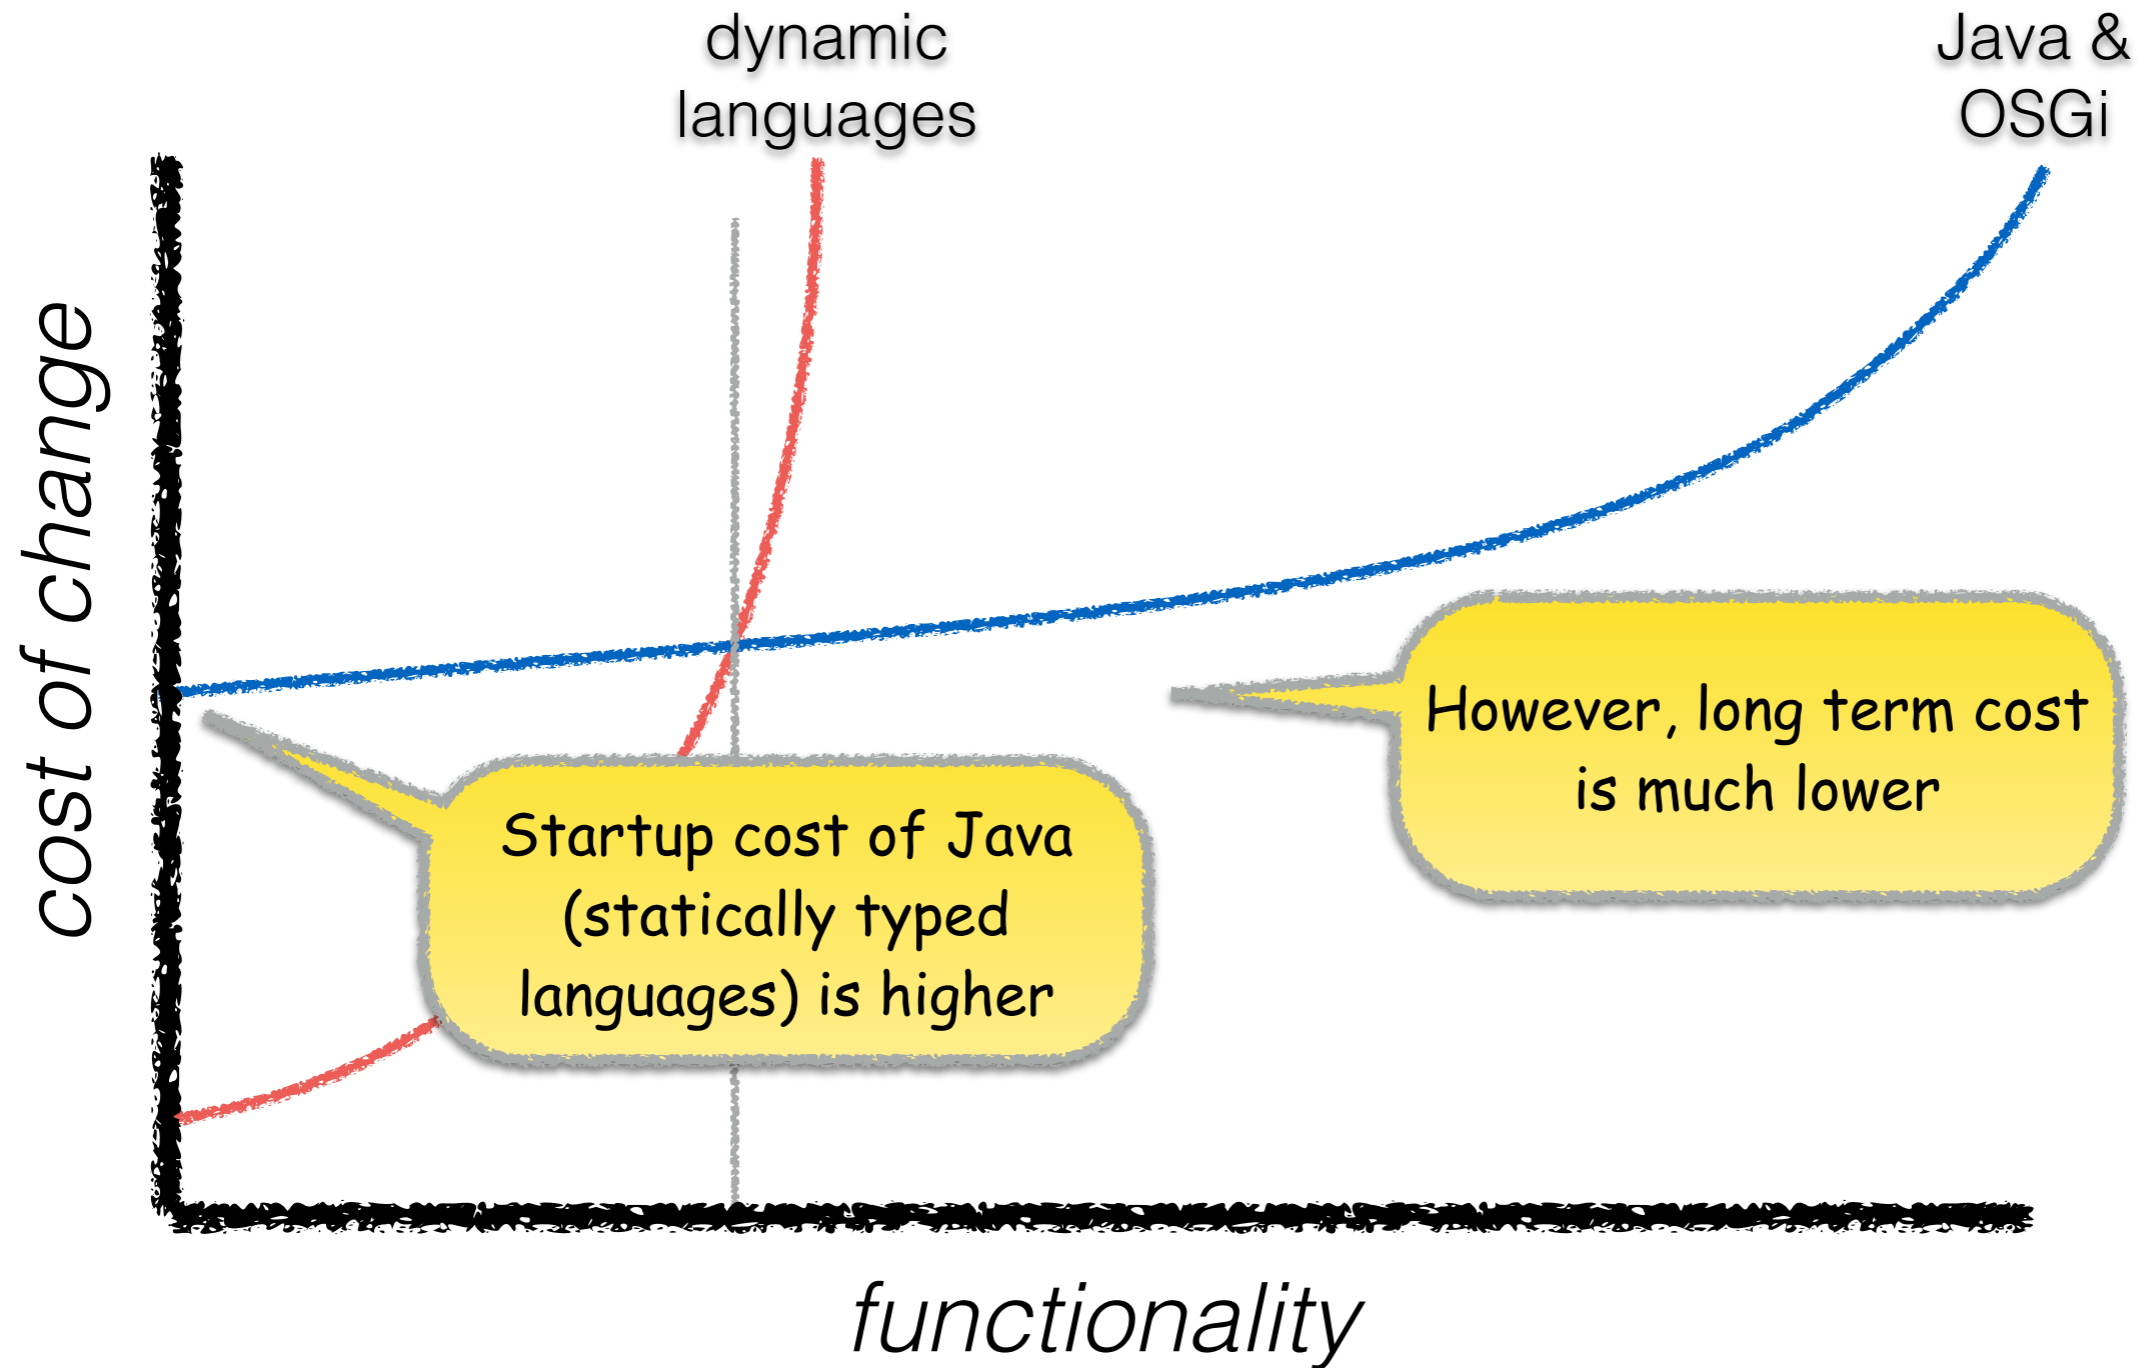

Dev Chain

Language

# Small versus Large

## Javascript

```
target.foo(15, "abc");
```

You **HOPE** target implements foo ...

## Java

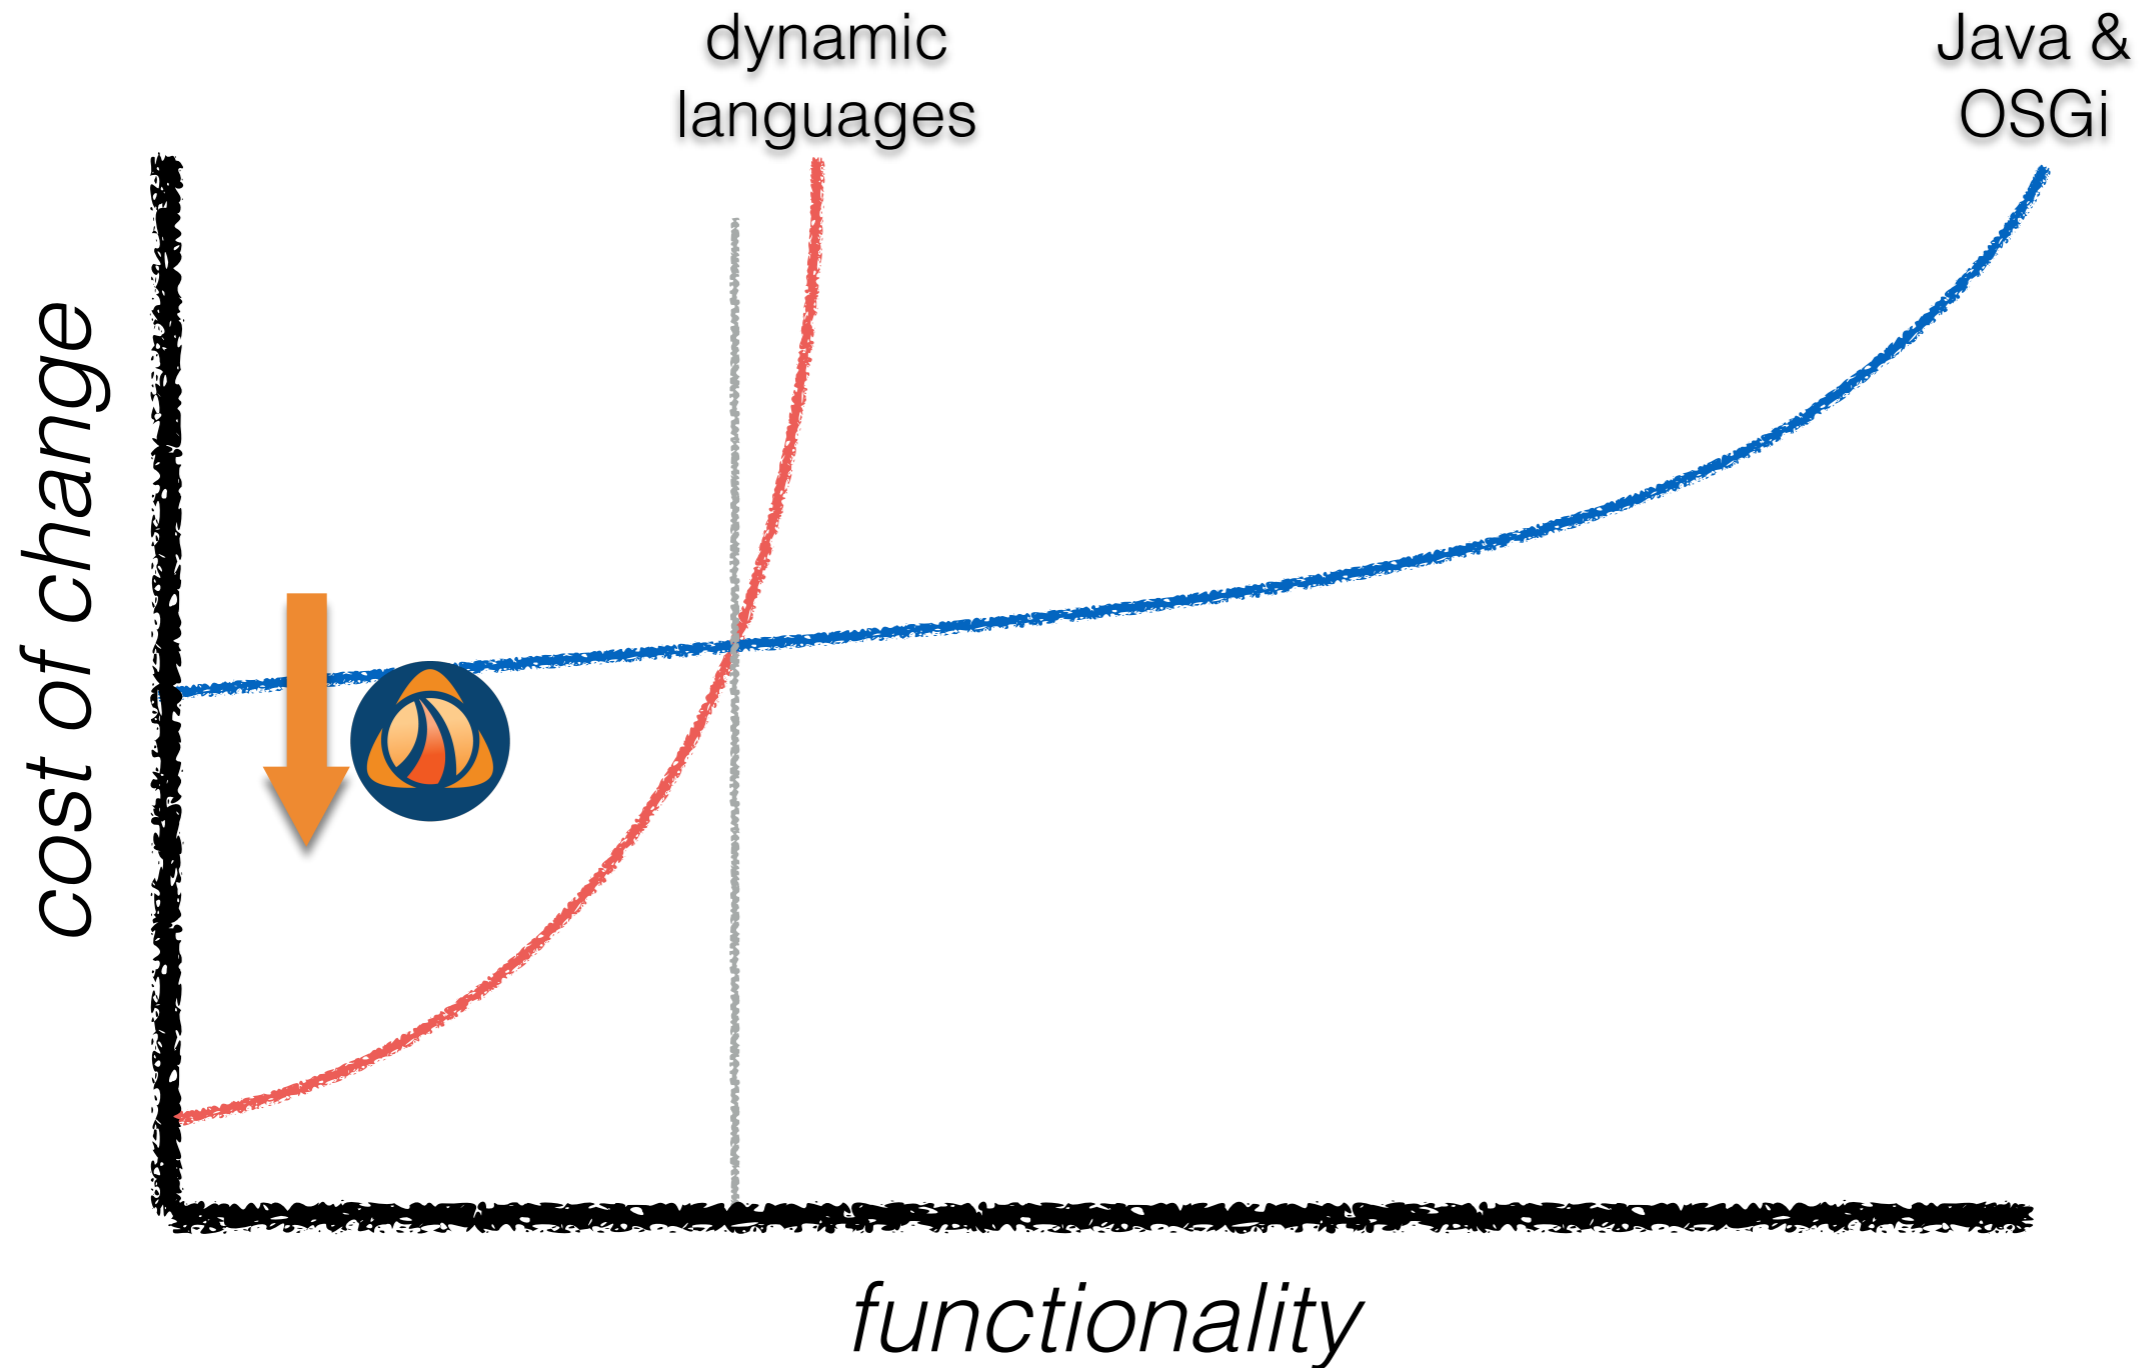

```
target.foo(15, "abc");
```

You **KNOW** target implements foo ...  
and expects an integer  
and a string

Your IDE knows exactly  
who is using this

# What is OSGi enRoute?

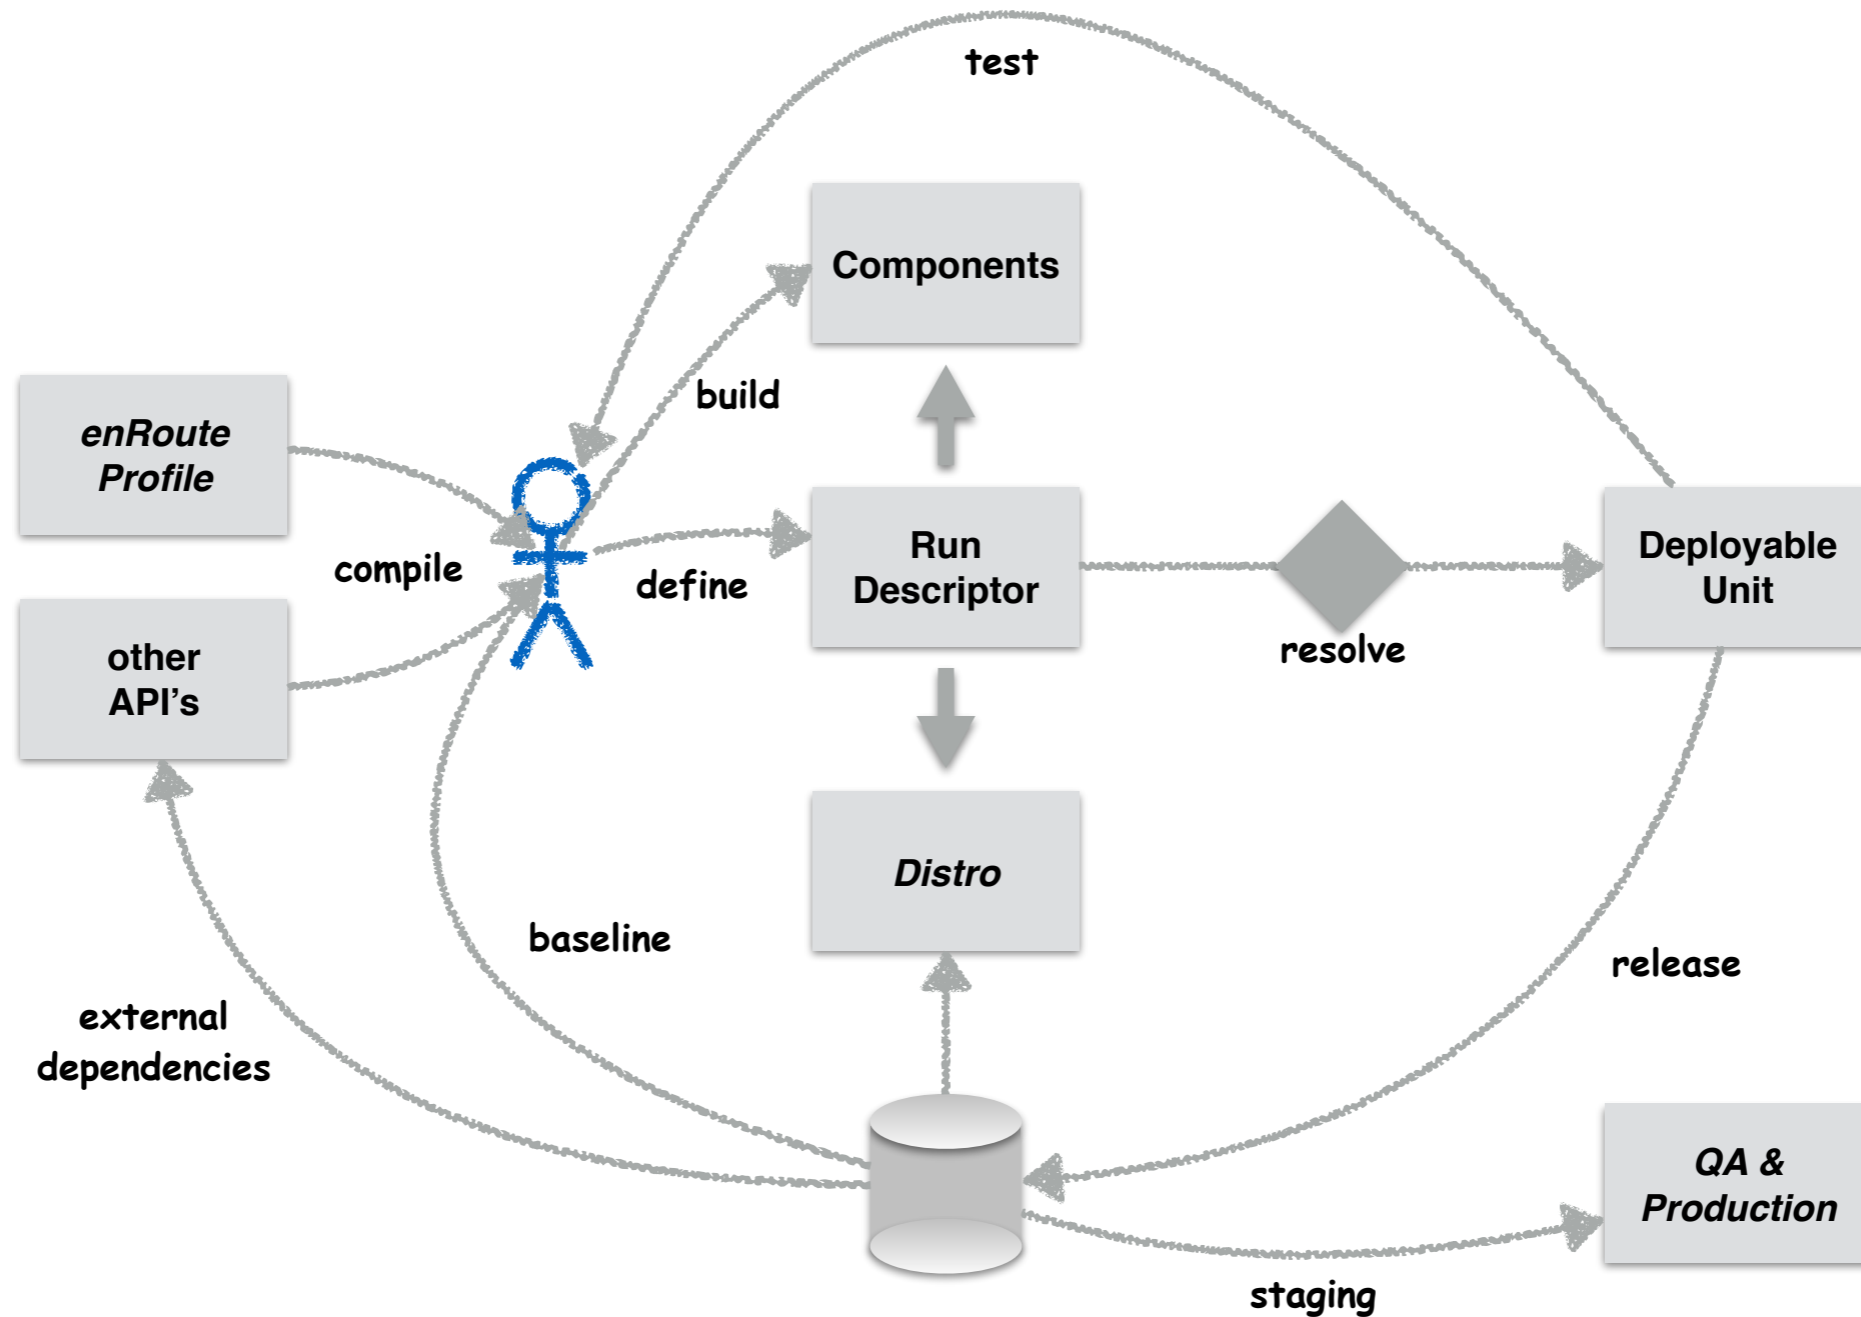

How?

# OSGi enRoute

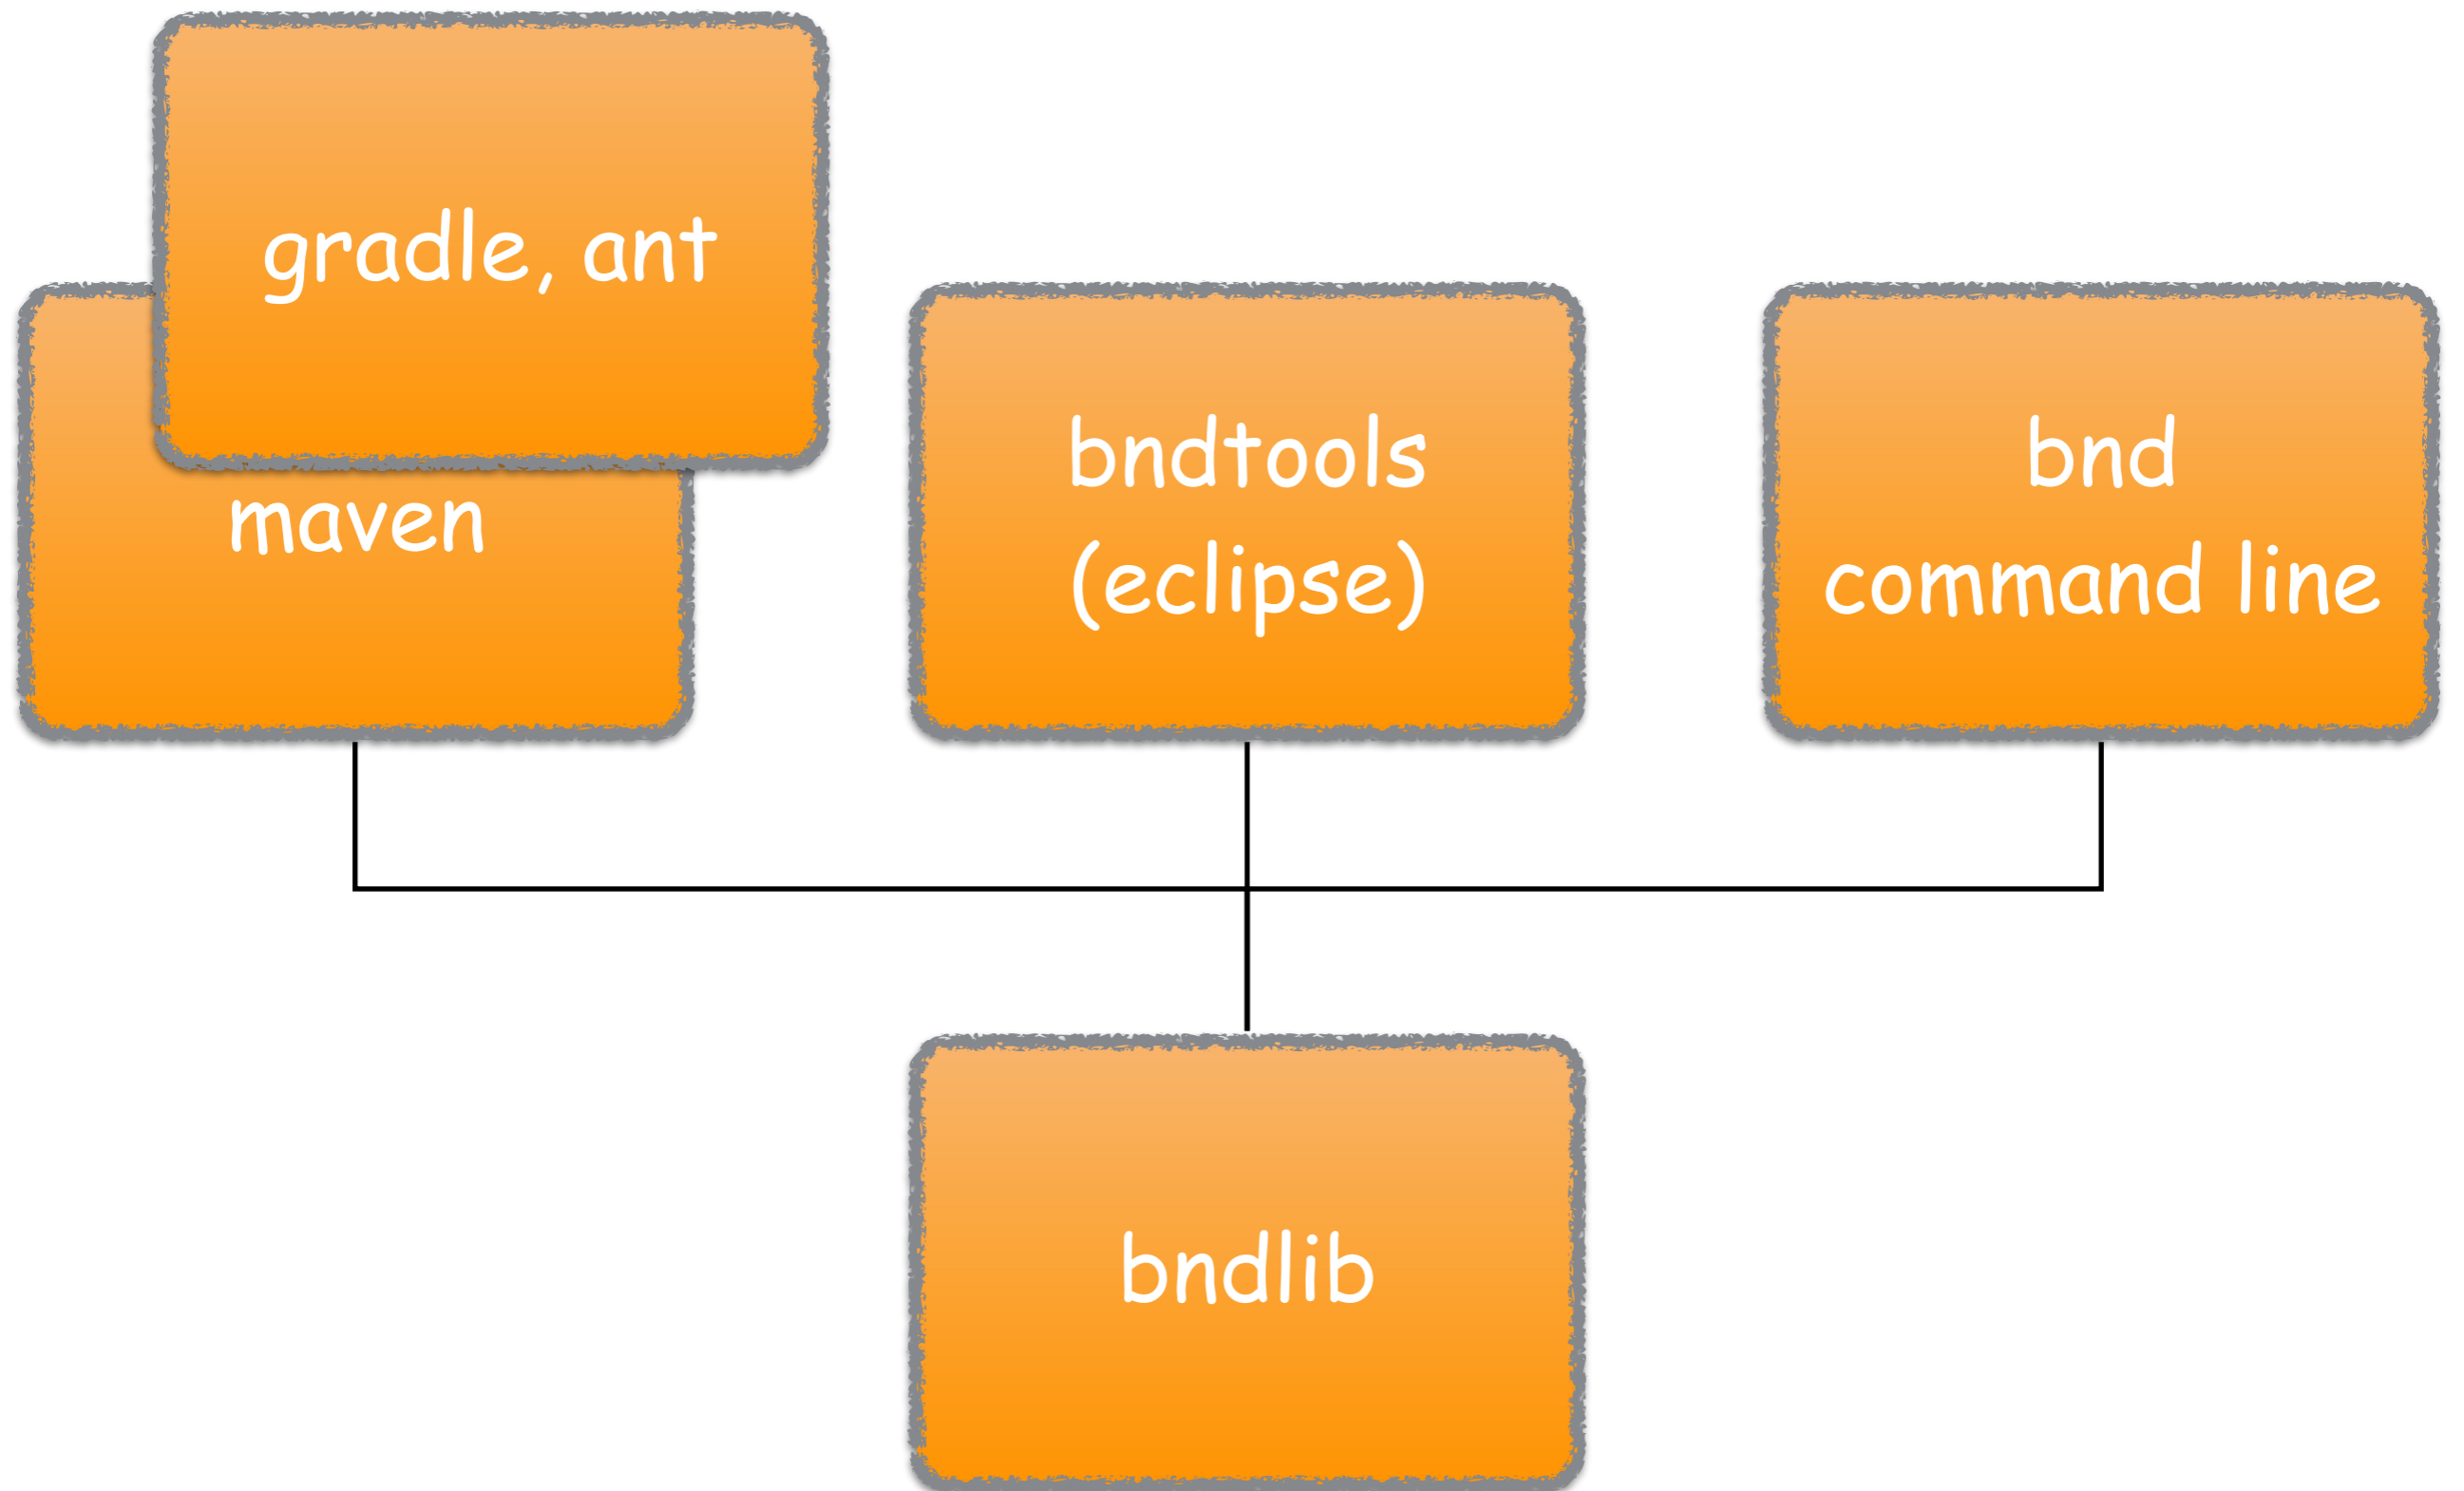

- μService Oriented Programming
  - To reduce system complexity
- Dependency Management
  - To reduce errors in development & operations
- Tooling
  - To reduce time to market
- Documentation & Training
  - To reduce confusion with developers

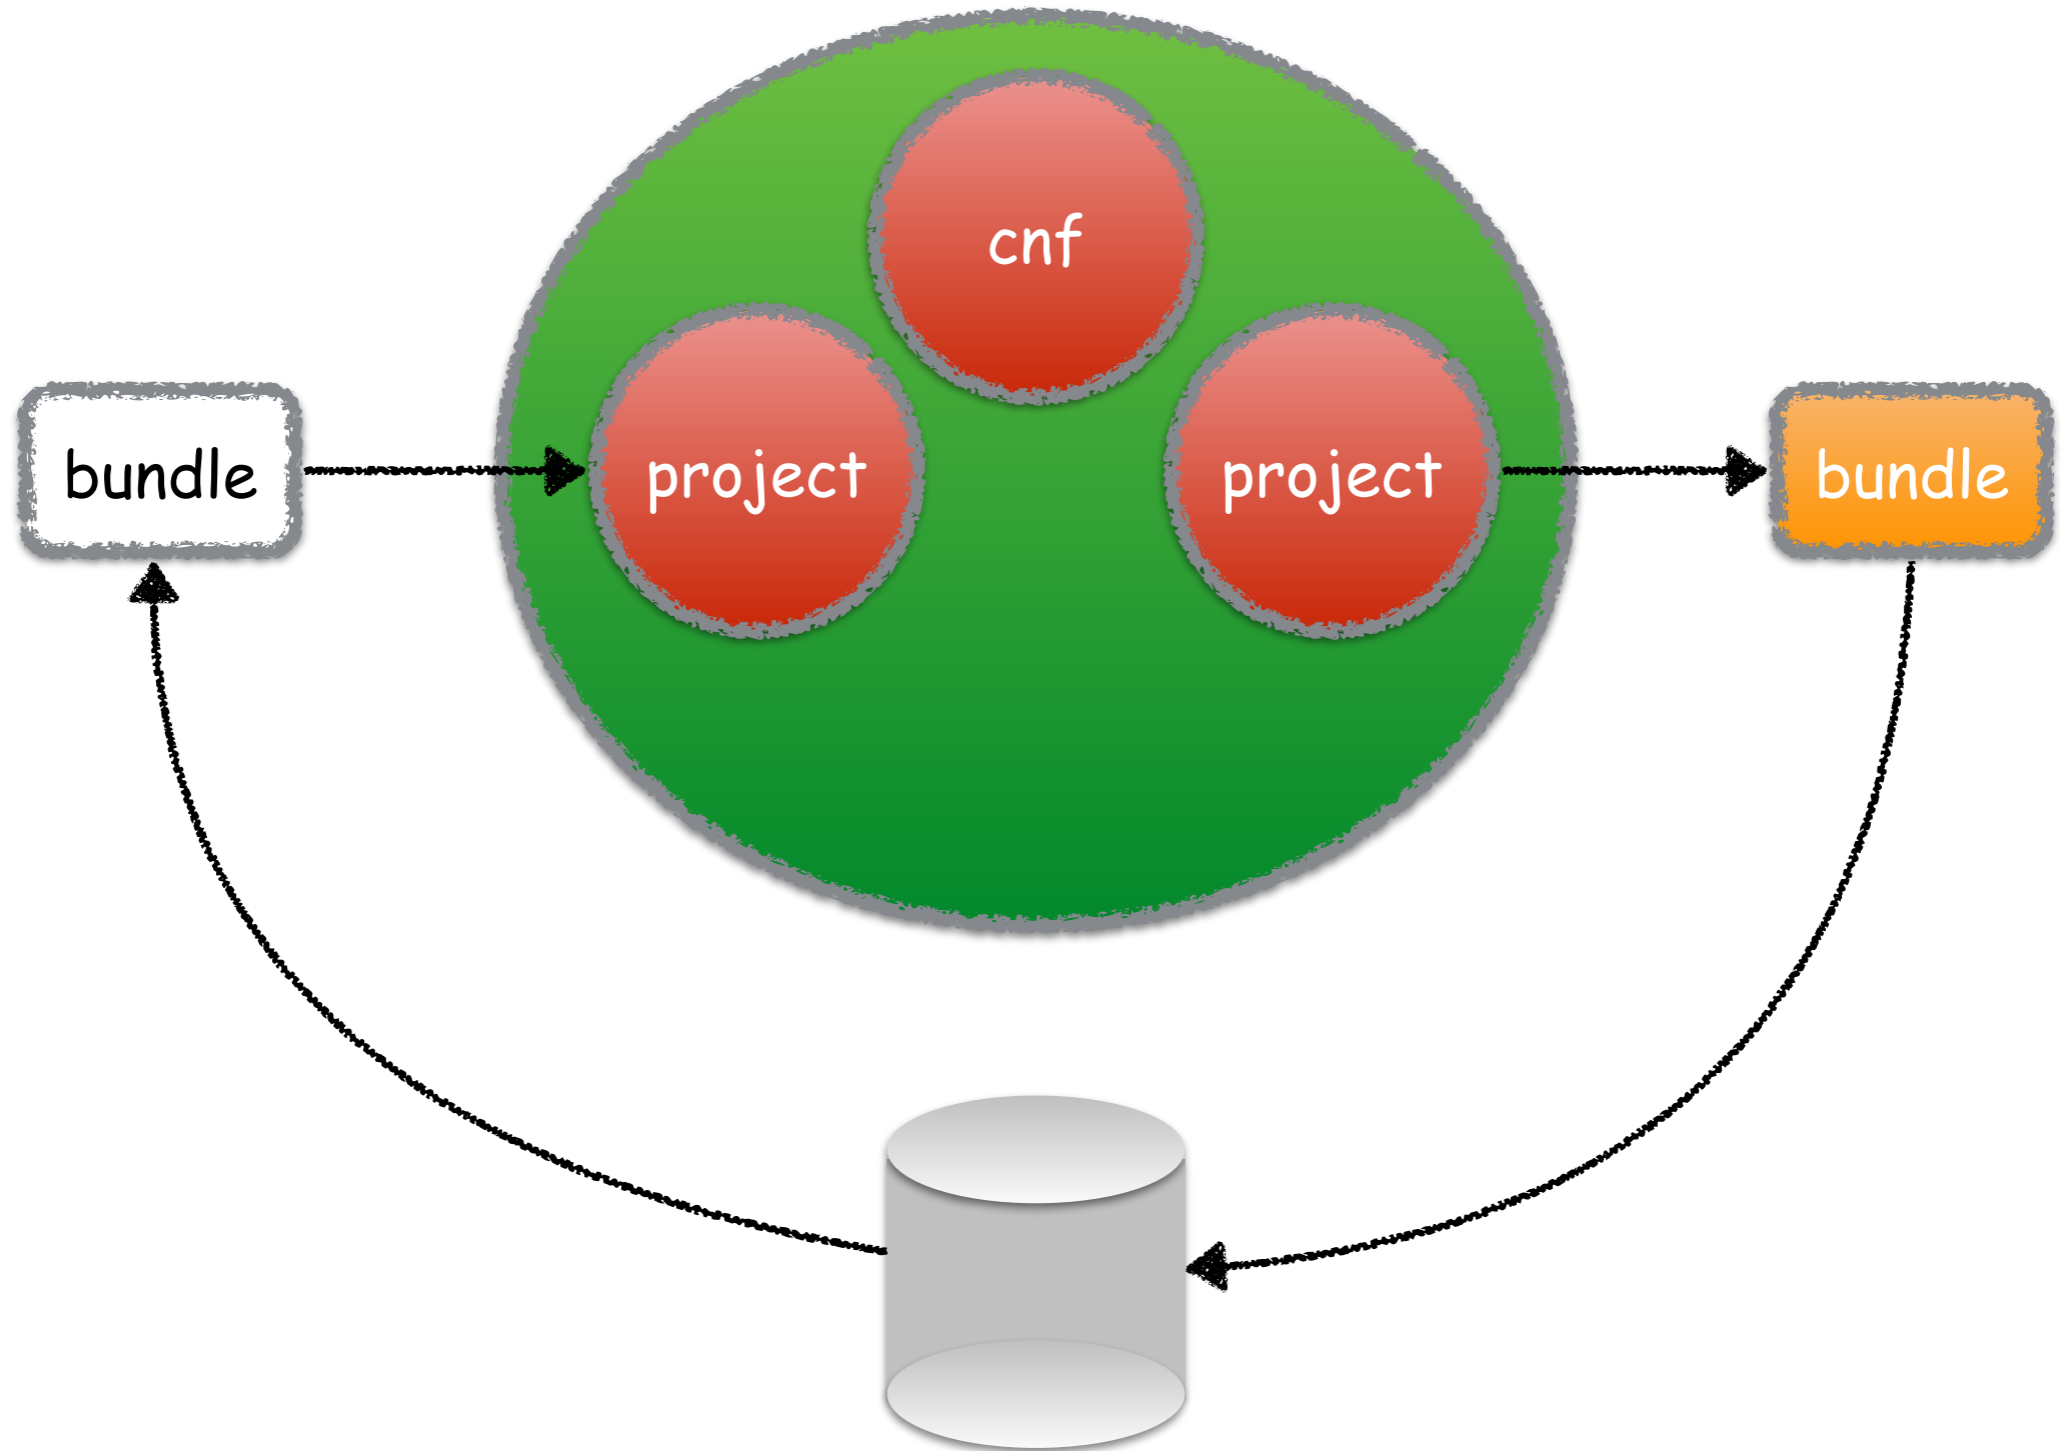

# Development Process

bnd, the little engine  
that built ...

# workspace

profiles

# Profiles

- A *profile* is specific catalog of *specifications* that vendors can provide in a *distribution*.
- An OSGi Profile consists of
  - **$\mu$ Services** — Specifications of either OSGi Alliance or external  $\mu$ services.
  - **Extenders** — An extender provides support functionality to OSGi bundles.
  - **Capabilities** — A capability describes a feature/function/resource of the underlying system in abstract format.

# Profiles

- Each OSGi enRoute Profile is represented by a clean signed JAR library that can be used to build bundles against.
- This is a **specification** only library,
  - It can not introduce unwanted dependencies, or
  - Let developers accidentally use proprietary features of a vendor

# Planned Profiles

- **java 1.8** — All profiles are based on Java 1.8
- **base** — A minimum profile, mostly as common base and for demonstrations. It provides support for the best practices in our industry.
- **base.debug** — Supports developing and debugging
- **web** — Web application development optimized for single page web apps.
- **web.debug** — Supports developing and debugging web apps.
- **persistence** — Provides support for JPA on OSGi

# Base Profile

- **OSGi Core Framework** — R6
- **OSGi Compendium** — ConfigurationAdmin, Coordinator, EventAdmin, LogService, MetaTypeService, UserAdmin
- **Logging** — Extensive Java Logging and SLF4J (dynamic!) logging support. Both service based and statics.
- **OSGi enRoute Support**
  - **Requirements and Capabilities** — Completely developed with the R&C model in mind
  - **Specifications in code** — Extensive support to use Java classes and interfaces to also specifies non-Java aspects. E.g. license headers, forms, versioning, etc. Mostly through annotations.

# Base Profile

- **OSGi enRoute services**
  - **Authenticator and Authority** — For extensible security
  - **ConfigurationDone** — To signal end of initialization at startup
  - **DTOs** — Extensive support for Data Transfer Objects (JSON, conversion, diffing, named access)
  - **Launched** — Provides access to startup parameters
  - **LoggerAdmin** — Administrative front end to logging. Can handle OSGi, SLF4J, and Java Logging
  - **java.util.Timer** — Scheduled tasks
  - **java.util.concurrent.Executor** — Background tasks

## New Bnd OSGi Project

## Project Templates

## Select Template:

-  Component Development (OSGi Declarative Services)
-  API Project
-  OSGi enRoute (alpha)
-  Integration Testing
-  Empty Project

## Description:

Creates a project for developing with enRoute base profile, a profile for basic OSGi applications. The profile is implemented in different . The name of the project must be a Bundle Symbolic Name (e.g. com.example.foo). The last segment of this name has special meaning for the chosen project template.

- — Create an example project with some stub code that demonstrates the key features of OSGi enRoute, like multiple bundles in one project, executable jars, debug configurations, etc. Choose this to play with bndtools/enRoute.
- — Create an API project. Use this when you have a service API that should be shared with others, i.e. it must be releasable as a separate bundle.
- — Create a provider project. Use this when you create an implementation of a service specification.
- — Create an OSGi JUnit test project.
- — Create an application project. An application usually contains little or no code but
